## Product features

Application S1A.. and S2A.. auxiliary switches are used to signal positions or to execute switching functions in any angular position.
Mode of operation A form-fit engagement is created between a driver disc and the clamp, causing the position to be directly transferred to the trip cams of the microswitches.
The switching points can be freely selected within the specified range of rotation by means of a dial. The current switch position can be read at any time.

Mounting The auxiliary switches are attached directly to the clamp of the damper actuator. The guiding grooves between the housing and the switch ensure a tightly sealing fit.
